

1 The Polish validation study included 28 data from bi- and multilingual families. Though it
2 is a small group, we decided to explore their correlation coefficients (non-parametric
3 Spearman's rho) and found these were similar to those found for Polish monolingual
4 children (see Table 1). Since the correlation coefficients were similar in both groups, and as
5 the bi- and multilingual group was too small to warrant a separate analysis, we
6 decided to include them in the Polish dataset alongside the Polish monolinguals.

Table 1

Table S1 - Spearman's correlations for monolingual and multilingual children in the Polish dataset

lang_group	r	n	correlation
monolingual	0.92	85	Ability from CDI-CAT ~ full CDI score
multilingual	0.90	28	Ability from CDI-CAT ~ full CDI score
monolingual	0.92	85	Ability from CDI-CAT ~ ability from full CDI
multilingual	0.90	28	Ability from CDI-CAT ~ ability from full CDI
monolingual	1.00	85	Ability from full CDI ~ full CDI score
multilingual	1.00	28	Ability from full CDI ~ full CDI score
